

Build Beyond: Move Smart Contract Code Camp By DEVCON & SUI

Attending the Move Smart Contract Code Camp, I think, was a very insightful experience for me. The seminar taught us about blockchain, the application of it, and its relevance. It was a fun experience also because everything went smoothly because of the guidance of the facilitators, they were very hands-on and helpful to all of us.

Throughout the event, I have learned a lot. I was introduced to Vercel, which I had never used before to deploy my projects. I learned about Git commands, and also we have encountered some errors, and I learned how to fix them. The highlight of the seminar was creating our very own portfolio on the SUI blockchain platform. I was able to make a digital portfolio, the UI was very cool, and I was able to include my educational background and skills. We have used object IDs, specific addresses for our portfolio object. One thing that I was really into was when we encountered some troubleshooting problems. In the computer lab, most of us encountered problems like "permission denied" when attempting to push code to GitHub because of some saved credentials from previous users, and we've learned to fix it by going to the credential manager and removing the entries there for GitHub that allow us to successfully authenticate. I love some troubleshooting learnings, that's why I enjoyed the seminar more. By this, it just shows how a significant part of the seminar teaches us that it's not all about coding but also understanding the environment in which we code and where the code lives. At the end, the successful deployment of my live portfolio to Vercel was the proof of my work.

The seminar piqued my interest in secure software development. Using or applying blockchain is relevant to this rapidly evolving blockchain industry, and learning about it in the seminar was an honor, as we also experienced performing an actual on-chain deployment. It was very full of knowledge, and I was glad I attended this seminar.
